are obtained for the cyclotron parameters. The values of A, B, and N measured for Ge satisfy these conditions at B < O and N < O. The values of the cyclotron parameters measured for non-deformed Si crystals (G. Dresselhaus et al., Phys. Rev., 98, 368, 1955; R. N. Dexter et al., J. Phys. Chem. Sol., 20, 281, 1961) fulfill the conditions at N<O whichever the sign of B. Results obtained for deformed Si crystals do not fulfill the conditions. This is explained by a change in cyclotron parameters on

TITLE:

Effect of non-parabolic bands on the hole mobility in

germanium and silicon

PERIODICAL:

Fizika tverdogo tela, v. 5, no. 1, 1963, 350-352

TEXT: The role played by non-parabolic valence bands in hole mobility was studied to explain why the hole mobility in Ge and Si at room temperature is inversely proportional to T2.3 (T is the absolute temperature). The assumption that an increase in hole mass with increasing energy (temperature) causes a decrease in hole mobility is based on a simple theory in which only carrier scattering by long-wave acoustic lattice vibrations is considered. In germanium this decrease in hole mobility can be neglected, not so in silicon. If the effective mass m in the relation  $\frac{1}{\mu} \sim m^{5/2}T^{3/2}$  (1) is replaced by the averaged mass  $\overline{m}(\xi) = \overline{m}(\Lambda)(\xi/\Lambda)^{0.3}$ , then (1) agrees approximately with the relation  $1/\mu \sim T^{2.3}$  determined experimentally.  $\Lambda$  is the spin-orbit splitting of the bands. Better agreement is reached in the Card 1/2

Effect of non-parabolic bands...

TITLE: Mobility of electrons in p-InSb
SOURCE: Fizika tverdogo tela, v. 8, no. 4, 1966, 1262-1263
TOPIC TAGS: indium compound, antimonide, electron mobility, photomagnetic effect, carrier density, hole mobility, phonon drag
ABSTRACT: The authors investigated the dragging of minority carriers in crystals by the majority carriers in p-InSb. The mobility of the electrons was determined by the photomagnetic effect using several samples, of which two were pure enough for the theory of the dragging effect to
be applicable $(7 \times 10^{13} \text{ and } 1.2 \times 10^{14} \text{ cm}^{-3} \text{ hole density at liquid-nitrogen temperature})$ . The measured electron mobilities in these samples
were 2.7 x 10 <sup>5</sup> and 1.9 x 10 <sup>5</sup> cm <sup>2</sup> /v-sec at 100K, and since the compensation of the acceptors was negligible in these samples the hole mobility was high. A theoretical estimate of the mobility of the electrons with allowance for their scattering by phonons, by ionized acceptors, and by
holes yields in this case values which are approximately twice the experi-

montol volume The said	3
mental values. The authors show by means of rough estimates that this discrepancy can be attributed to dragging, which increases by three orders of magnitude the contribution made to the scattering of electroby light holes. Although more accurate calculations are needed for a reliable determination of the law of dragging of electrons by holes, its concluded that the dragging effect is quite strong and that the effective mass of the light holes amounts to approximately 0.015mg. Abst Journal: Referat Zhur - Khimiya, No 2, 1957, 5495

Abstract: of 50°) and was held at this temperature for 30 minutes. For each temperature a determination was made, of the amount of E2S formed, of low boiling mercaptanes and of the amount of S in distillate and residue. It is shown that in all petroleum varieties of Kuybyshev Oblast H2S is found in dissolved state, but in the petroleum distillation processes the principal effect is produced by H2S of secondary origin. All the investigated varieties of petroleum are characterized by a relatively high thermal stability of sulfur compounds in the temperature range up to 1500. Petroleum varieties of Upper Devonian are characterized by a high thermal stability of sulfur compounds up to 3500. Further increase of the temperature increases the formation of H2S by several times, therefore on distillation of petroleum of the Kuybyshev Oblast the maximum permissible temperature at the exit from the atmospheric portion of the furnace must be considered to be 350°. Petroleum varieties of the carboniferous series are characterized by the formation of considerable amounts of H2S already at 190-2100. The different behavior of sulfur compounds of

Linear Differential Equations (Cont.)

SOV/4905

PURPOSE: This book is intended for scientific workers, engineers, aspirants, and students in advanced courses at universities.

COVERAGE: The book presents investigations of linear differential equations with variable coefficients. According to the author, the highly important problem of the stability and instability of solutions of equations with quasi-periodic coefficients is solved in this book. Criteria obtained by him are of great importance for the development of the theory of the equations considered in this book, and for the applications to various mechanical and technical problems. Equations, systems of equations, and the asymptotic character of the approximate solutions of such equations and systems of equations are discussed in detail. Stability and instability criteria of the solutions of the examined systems of equations are also considered. Practical applications of the results obtained are included. N. M. Krylov and N. N. Bogolyubov, authors in related fields of science, are mentioned. There are 82

TITLE:

Co-Precipitation in Quantitative Analysis (Soosazhdeniye v kolichestvennom analize). Communication V (Soobshcheniye V). The Influence Exercised by Complexon Upon the Precipitation of Zirconium Phosphate (Vliyaniye kompleksona na osazhdeniye

fosfata tsirkoniya)

PERIODICAL:

Zavodskaya Laboratoriya, 1958, Vol 24, Nr 6, pp 674-677 (USSR)

ABSTRACT:

"Hidden precipitants" are frequently used for the separation of numerous elements, because the forming of crystals is retarded by a formation in stages of the precipitation anions, so that, as e.g., in the presence of pyridine, denser sulfide precipitations are obtained. In the present paper the influence exercised by ethylene-diamino-tetraacetic acid upon some processes of precipitation is investigated, because a sharp modification of the form of precipitation as well as a decrease of co-precipitation was observed. Data concerning the separation of zirconium and titanium by means of the phosphate method are given. Zirconium was transferred before precipitation with trilon in a weakly acid medium into a complex, and after precipitation it was found that the precipitation

Card 1/2

Co-Precipitation in Quantitative Analysis. Communication V. The Influence Exercised by Complexon Upon the Precipitation of Zirconium Phosphate

32-24-6-4/44

obtained was much more dense and more easily filtratable than that to which no trilon was added, and also electronmicroscopic photos showed a difference. The observation made to the effect that precipitation comes to a standstill if acidity increases is explained by the presence of two forms of ions, viz., of zirconyl ZrO+2 and zirconium Zx+4. From the method of operation described it follows that for the quantitative precipitation of zirconium phosphate from the trilon complex acidification of up to 3-4 n must be carried out. The experimental separation of zirconium and titanium showed that, in the presence of trilon the co-precipitation of titanium is decreased by more than ten times its amount if trilon is present in the case of phosphate precipitation, whereas, if triethylphosphate is used as a "hidden precipitant" no positive results were obtained, which is explained by the decomposition of hydrogen peroxide after long boiling. TITLE:

Coprecipitation of Fe3+ and MnO4 Ions with Slightly

Soluble Sulfates

PERIODICAL:

Dopovidi Akademii Nauk Ukrains koi RSR, 1959, Nr 7, pp 766-768 (UkrSSR)

ABSTRACT:

The authors studied the coprecipitation of permanganate and iron with precipitates of barium, lead, strontium, and calcium sulfates. It is shown that the coprecipitation of permanganate decreases slightly from barium to lead and strontium, and sharply decreases when passing on to CaSO<sub>4</sub>. A comparison of the degree of coprecipitation of permanganate with the parameters of the crystal lattices of these sulfates confirms the fact that the coprecipitation of KMnO<sub>4</sub> is mainly due to the formation of solid solutions. The coprecipitation of iron is of different character (inner adsorption) and is linked rather with the form of the crystals. There are 2 tables and 3

Co-presipitation in Quantitative Analysis (Scosazhdeniye v kolichestvennom aralize). Investigation of Crystal Growth of Barium Sulfate (Izucheniye rosta kristallov sernokislogo

barlya)

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 7, pp 779-762 (USSR)

ABSTRACT:

In spite of investigations hitherto carried out on crystallization of barium sulfate (I) the problem is not solved whether the growth process takes place in an agglomeration of cross-shaped particles, an enlargement of "snow flakes" while retaining the shape or by an aggregate of the small particles. In the present case various crystallization stages of (I) were investigated by the aid of an electron microscope thus employing a different preparation technique. It was found that two kinds of crystal growth of the primary (I) crystals exist; the first variation occurs by the continuation of the reaction of

Be2+ and So2 whereas

aging causes completely different

alterations. In both cases larger crystals with a regular

Card :/2

Co-precipitation in Quantitative Analysis. Investigation of Crystal Growth of Barium Sulfate SOV/32-25-7-2/50

shape are formed, in the case of aging, however, it takes place by decomposition of the sharp edges of individual pross-shaped double crystals. Some microphotographs of crystals are given (Figs 1-5). In order to determine the connection between the shape of particles of the solid phase and its absorptive power, ou-presipitations of (I) with KCl and KMnO, were carried out.

It was found that in both bases oc-precipitation is considerably higher if crystals are formed with a ramified surface. There are 5 figures and 7 references, 3 of which are Soviet.

ACCESSION NR: AP4021983

s/0073/64/030/002/0220/0223

AUTHOR: Babko, A. K.; Shtokalo, M. I.

TITLE: Investigation of reagents for the colorimetric determination of tantalum

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 30, no. 2, 1964, 220-223

TOPIC TAGS: tantalum, niobium, titanium, colorimetric analysis, color reagent, hematoxylin, pyrocatechol violet, phenylfluorin, arsenazo I, eriochromcyanin, acid chrome blue, morin, colorimetric determination, reagent specificity

ABSTRACT: A group of color reagents found earlier (Ukr, khim. zh 29, 963 (1963)) to be suitable for identifying tantalum according to their spectrophotometric characteristics are now further investigated to determine their specificity for Ta and Nb, and to determine the optimum pH. The color intensity of Ta, Nb, and Ti complexes with hematoxylin (I), pyrocatechol violet (II), phenylfluorin (III), arsenazo I (IV), eriochromcyanin (V), acid chrome blue (VI) and morin (VII) at pH 0-5, and of I, IV and VII in 5-10 NHCl solutions was determined, Hematoxylin, pyrocatechol violet and morin are the most valuable reagents for determining Ta and Nb in the presence of Ti. Hematoxylin and morin may be used to

Card 1/2

EXCHAPARENTING TANDER PROPERTY OF THE PROPERTY

ACCESSION NR: AP4021983 ·

determine total Ta and Nb. Additional work with pyrocatechol violet (PKV) shows that it may be used for the colorimetric determination of Ta in the presence of Nb. In the presence of ethylenediaminetetraacetic acid its coloration is intensified, distinguishing Ta from Nb; the optimum density of the Ta-PKV complex follows Beer's law in a wide concentration range. Orig. art. has: 4 figures and 1 table.
